Track Unifying add-in

Integrate information for tracks within your current system in a simple and complete way according to your needs and from a single component. You configure where to send your tracks easily

Track Unifyng add-in allows to integrate a component that track information from your system.
The unifying tracking plugin allows you to integrate a component that tracks your system information.

This component allows through a configuration which will be the destination where the audit trails will be deposited.
Once this add-in is included in your application natively, it will be reporting data such as:

- IP of the Origin machine
- Track generation date and time
- Request token that generated the request
- Among other things

The databases where the tracks can be persisted can be among others:

- Azure SQL Database
- SQL Server in virtual machine
- Azure Database for PostgreSQL
