

DIGITAL SIGNING

Telia Sign allows you to give up traditional time-consuming and resource-intensive signing methods. Electronic signatures allow signatures to be collected quickly and reliably, eliminating the need to print, send or scan additional paperwork.

Signature requests can be created with an easy-to-use portal. The service can also be flexibly integrated into the company's existing systems, in which case, for example signature requests can be created, through the company's own CRM system.

The service is designed for companies of all sizes. The basic service includes an immediately ready-to-use portal. The basic service can be expanded with the Enterprise package, which offers several additional services and customization options.

MODERN AND ENVIRONMENTALLY FRIENDLY SOLUTION

Fast: About half of the signatures are received within two hours of sending the signature request.

Immediately ready for use: The basic service is immediately available without complicated configurations.

Independent of time and place: Signatures can be made, for example, on a mobile device.

Trusted: Signatories are strongly identified with either a mobile certificate or an online banking identifier. The validity and integrity of a signed document is verified each time the document is opened in Adobe Reader, and no separate verification service is required.

Archive: Telia Sign offers ready-made integration into the Telia Arkisto service. Alternatively, the signed documents can also be transferred to the company's existing archive solution via API.

ADDITIONAL INFORMATION

THIS IS INCLUDED

- ready-to-use portal
- eIDAS level signing
- Strong identification
- Unlimited users

THIS IS WHAT YOU CAN ADD

- API
- Archiving
- SSO
