Discover people's true behavior and intentions with Voicesense predictive analytics

Using Artificial Intelligence and Machine Learning, we provide personalized results by "listening" to your voice, revealing a person's behavior attributes and tendencies across a wide range of fields: Risk Management, Human Capital Recruiting and Retention, Sales Conversion and Healthcare & Mental Wellness

The Technology of Voicesense

Our pioneering, patented approach, analyzes voice patterns, leveraging the non-content part of speech called prosody, such as intonation, pace, emphasis - we then link these patterns to behavioral and personal characteristics to produce personalized results for our customers.

Tap into our Data Bank

We have an extensive library of voice (deep) analytics, across multiple cultures and languages. Thus, from the start, we can provide actionable and empowering insights for our customers. From this base, we refine, and collaborate, for your use-cases to deliver truly game changing analytics.

Knowledge Is Key

We not only provide initial predictive scoring of your customer intentions and personality profile - but we can also provide on going tracking of changes to individuals' behavioral profiles: Examples - is someone more likely to buy products today (then yesterday); Is someone burned-out and stressed from work. Let us help guide you.

It's not what you say, but how you say it

Imagine if you could analyze voice interactions in seconds, on the first interaction with a person, forecasting the future behavior of the person you're talking to...Yes, that would be valuable for any organization.

Personalize Your Use-Cases

We measure over 200 parameters related to voice - such as Intonation, Frequency, and pacing - these parameters give us the ability to provide an ultra personalized decision-making tool across cultures and languages.

Real-Time Analysis

Like everything in life - Timing is everything. Our solutions are therefore designed to offer you insights in real time. Thus, giving our customers the most precious of all assets- Time!

Real Science

Our solution is based on extensive psychological research in the field of prosody. All our use cases are pre-tested and validated throughout the process - all backed by documented historic clinical trials.

Voicesense and Azure

Combining Voicesense and Azure allows you to have endless possibilities, in no time, one click away...

seamless

With Azure, you can enjoy the full power of Voicesense, without any holdbacks. Just click and deploy.

scalable

Upgrading is a breeze, you don't need to break your teeth with this nut - work at any volume, instantly.

secure

Sleep well at night knowing that your data is safe and sound with Azure

Listen to a Voicesense User

"Our experience working with Voicesense was excellent. We found it as most effective as an AI predictive loan default tool, and more importantly from a business perspective.

We apply our own AI analytics, yet our data science research team showed that Voicesense's behavioral voice analysis improved our predictions significantly. It actually reduced our default rate by about 5%"

- Sebastian Ibarguen, CEO, Vana

Customer classification

Know who your costumers are - by classifying Vana's costumers around specific personality attributes, they were able to tailor each specific customer product offer to maximize probability of repayment.

Reduction of costs

By storing customer profiles - on the first call, and after - credit companies, like Vana, can harness data science. Through data derived from Voicesense analytics, they can focus their marketing and retention campaigns on known successful customer profiles.

Save valuable resources

Vana's early, and uncorrelated insights from Voicesense, into their costumers behavioral attributes, enabled them to save valuable capital and human resources - avoiding more, unnecessary long and tedious collection efforts.

Voicesense Enterprise Group

Sales Conversion

Identify those high converting callers and leads at the top of the sales funnel, in seconds, using only the sound of their voice. We link typical speech patterns with behavioral tendencies to provide real-time monitoring of the customer and agent's disposition as well as interaction guidance.

FinTech - Risk Management

We work with financial institutions that provide credit facilities, and in the cases of default, we assist those companies that specialize in pricing and collecting bad debt – simply put, our Risk Management product can give companies an independent assessment of whether someone has a high or low propensity to adhere to their credit / debt obligations. Because our assessment is completely uncorrelated to any other credit risk assessment, we can be placed at the “top of the risk pyramid” of any risk model, sophisticated (AI driven) or not, and have a discernible and incremental value to their risk management function.

Talent Recruiting & Retention

Liberate your hiring teams from the tactical screening process. Our acoustic analytics empowers your recruiters to do their most valuable work by focusing on the candidates that matter the most. Prevent churn and gain key insights into your employee's wellbeing. Clearly, any insight – especially early and predictive – is an advantage.

Voicesense Health & Mental Wellness

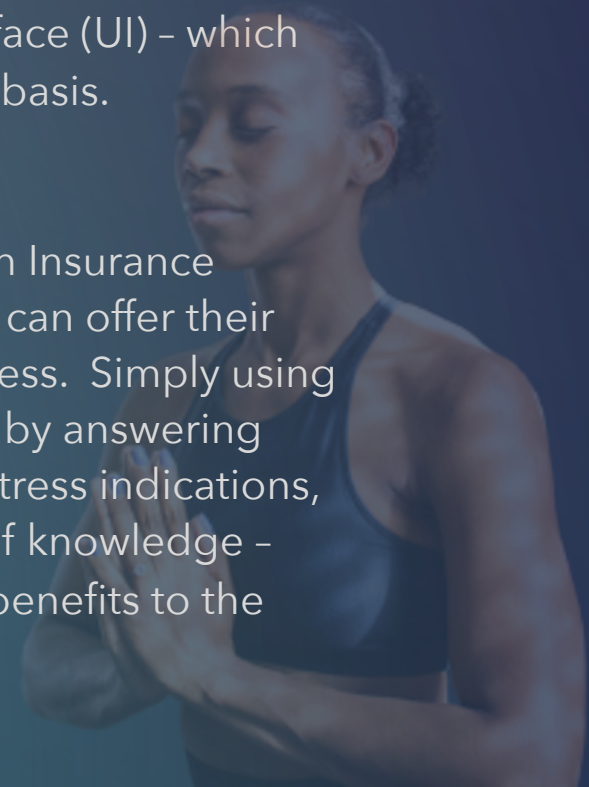

Professional Diagnostics & Monitoring

For the Professional Medical and Health related industries - Hospital, Medical Centers, First Responders, Care homes, and Insurance Groups - we provide mental health assessments, on a stand-alone basis, or importantly, augmenting existing mental health diagnostic tools. After the diagnostic process and assessments, we provide automated tracking of changes to mental health states. This enables medical professionals to provide constant monitoring of patient's mental wellness throughout any treatment regiment. We provide this remotely, in an easy to use - Web-based or App, User Interface (UI) - which enables ease of adoption, and ultimately, better patient care, on a more cost-effective basis.

Personal Assessment and Wellness Management

We provide companies and organizations - such as multi-national Corporations, Health Insurance Groups, and Colleges & Universities - an easy to use App (Apple & Android) that they can offer their members to manage, securely and privately, their own personal mental health & wellness. Simply using the App, either by making phone calls to any of their contacts or recording their voice by answering daily questions, the personal user can understand their general mental health state - stress indications, energy levels, and coping mechanism. For the group providing its members the gift of knowledge - daily and historical mental wellness assessments - it is a gift that also provides untold benefits to the giver.

Were you listening? We are.
