Get things optimized

Today's knowledge work is broken

Copy-paste-copy-paste-copy-paste all the time
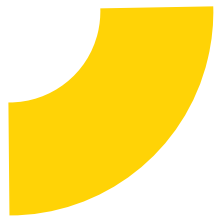

Searching those damn files and relevant information

Updating that boring report every Monday

Waiting for that report to download which takes soo long...

Responding to the same questions over email/slack/whatever

So much talent wasted.

It's 2020's.

Modern work could and should be free of manual and repetitive work. Of course we're trying; we have RPA, process mining, lean etc.

How is the reality still in companies?

A real snapshot of a finance and accounting team.

25+
repetitive workflows

20%
of work cyclical responses to emails

30%
of work repetitive updating of Excels

50
hours entering data manually
to business apps

5.000
copy-paste operations

1/3
of work in non-preferred systems

One team. One week. After 3+ years of RPA program and process mining try-outs.

What went wrong?

If you search problems manually, you miss the most opportunities.

Automated discovery of opportunities makes finding development potential easy, fast and comprehensive.

Workfellow discovers automation, digitization and optimization opportunities automatically

Workfellow analyzes activities and manual data flows between business applications and documents. As a result, it identifies manual, repetitive and fragmented processes and workflows to be fixed.

Workview
Work is a mess for even the best teams – here is the real modern teams' weekly over business applications and documents. Drill into the opportunities.

Hidden opportunities are visible only with automated discovery

Manual discoveries are narrow and often single solution focused, or take way too much time. Automated discovery covers all work and is solution agnostic.

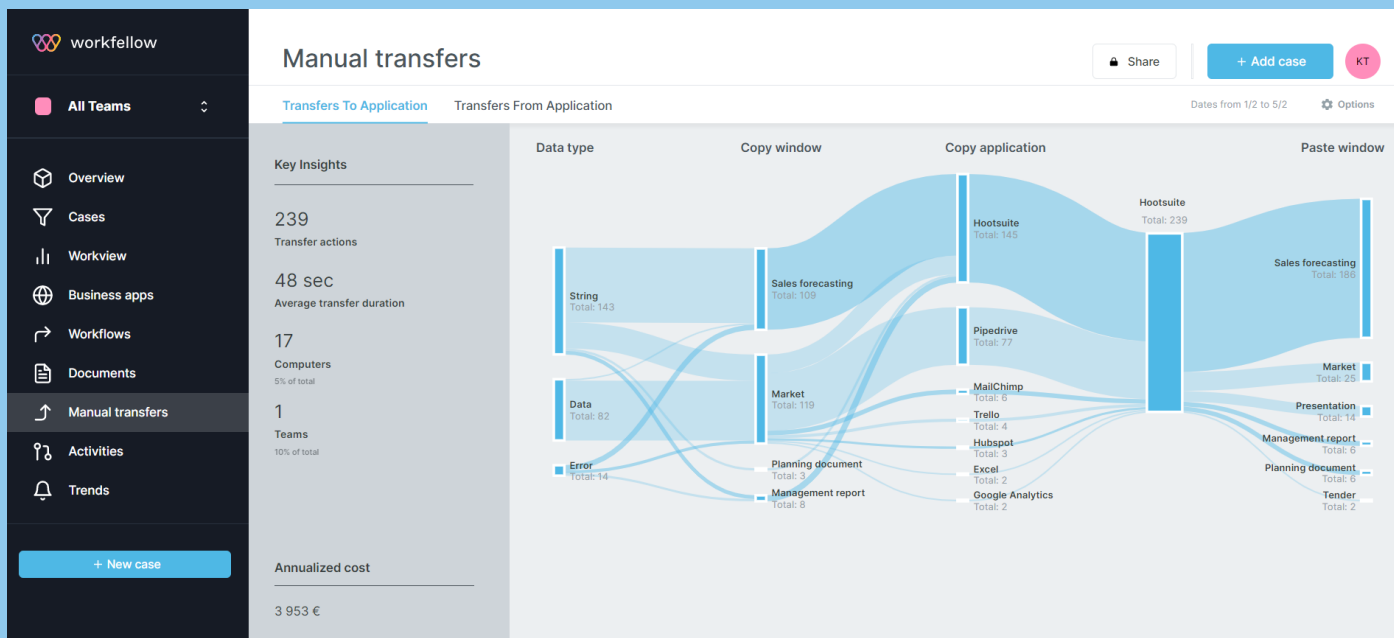

Activities

Transparency of time/cost of doing manual activities, for example manual text entries to different applications, allow us to make justified decisions on creating automations.

Comprehensive data enables smarter decisions

With all data in your hands, you can make smart decisions to digitize operations, automate workflows and integrate data flows. Understanding systematic problems first prevents you from making unnecessary investments.

Manual transfers
Understanding manual data copies between applications unveils the need for integrations and automations.

Automated discovery saves valuable time of all parties

Development initiatives are always a teamwork of many, for example, subject-matter-experts, process owners, and automation experts. With automated discovery you can skip the workshops and process walkthrough before data suggests it.

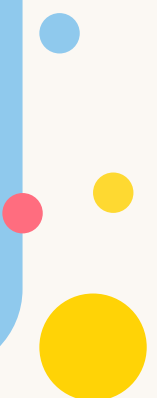

Funnel

Workfellow makes change implementation easy across teams and functions.

I must say that there is no easier way of getting started

① Install plug-in to your computers to connect with Workfellow Cloud. No worries, that's easily done by IT.

② Relax, while Workfellow analyzes your business-related work absolutely anonymously and forms it into valuable insights.

③ Start to improve your operations based on suggested opportunities with your teams.

④ Voila. That's about it.

workfellow.ai

"Workfellow Cloud handles all the hassle without needs for customization or integration

---

☑ Plug-to-actions in a week

☑ No customization

☑ It's also for business people

☑ Anonymity guaranteed

Covers

☑ All workflows

☑ All business systems

☑ All work operations
