

# Integration for professionals

The screenshot displays the Integrify web interface for configuring a task. The top navigation bar includes 'Home', 'Load testing NEW', and 'Tasks > 20 - Post endpoint 10'. A sidebar on the left lists various configuration options: Configuration, Tasks, Endpoints, Agents, Data schemas, Configurations, Config transfer, Endpoint tokens, Variables, Log setup, Log hub rules, and Log writers. The main workspace shows a task configuration for 'Post endpoint 10' with a priority of 10 and 100 max instances. The workflow consists of several steps, each using 'JS Mapper v3.0.3' and 'On Background' components. The steps are connected in a sequence, with each step receiving 'Load input' and performing 'JS Mapping Statement (Message to m...)'. The interface also includes a 'Clean scheduled' button and a 'Keep run data' option.

# Possibilities of integration solutions

## B2C applications

## corporate applications

## internal team

## platform

Not suitable for Enterprise integration

It does not allow the transformation and transfer of large volumes of data

It doesn't watch for errors in streaming data

It targets end users while IT loses control and visibility into usage

Complex development environment (not low-code)

Inflexible for large development teams

Complex onboarding new team members

Hardly available support unless you are among the world's largest customers

High costs of team operation and development

High risk of errors and outages

People do work that could be replaced by software

Know-how often leaves with the person who created the integration

**Stability** thanks to a robust and reliable system

**High security** and resistance to attacks and human error

**Scalability** and readiness for large volumes of transferred data

**Excellent support** in case something goes wrong

# The future is an integration platform as a service

1 It securely connects systems in the cloud with those running locally

Thanks to the unique architecture, you can reliably and **securely connect all systems**, data sources, and devices regardless of whether it runs on your network or in the cloud. All you need for this is HTTPS outbound. Nothing more.

2 It provides a comprehensive overview and enables the detection of weak points

Using a clear dashboard, you can **monitor the progress of your integrations in real-time** and detect in time if something is wrong somewhere.

3 It offers unlimited possibilities to scale and change whenever needed

We know how dynamically the world changes and how quickly it is necessary to be able to react. **Integrify can adapt to** constantly changing conditions, performance demands, and business needs.

# Key features of the platform

## Stable integration oriented towards extreme performance

Integray with the knowledge that it provides **critical integrations in companies that require extraordinary stability and performance**.

**500+**

operations per second

**600MB**

per second (throughput)

## Pre-prepared connectors and space for your own

Our **connector database is constantly growing**, but if you don't find the one you need, you can easily create a new one or modify an existing one.

**100+**

available connectors

Most frequently used:

REST API

JS Mapper

Node.JS

Python

Microsoft SQL

Oracle SQL

PostgreSQL

## Fair licensing and low operating costs

Although we develop Integray for large companies, we want it to be accessible to smaller ones as well. Therefore, you can use it **as intensively as you want** and with all the functions.

## Parallel running integration

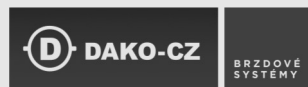

they are the only item that determines the price. You do not pay for the number of transactions, connected systems or the volume of data transferred.

# Integray **already uses** for example:

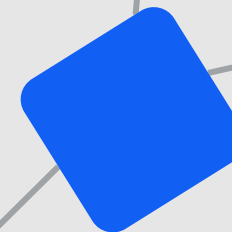

**M E W S**

**Mountfield**

**...and dozens of other companies.**

# Integray manages **integration at Scania**

In the projects we have digitized at Scania, Integray plays a key role.

Mountfield

# Software with first class support

## Learning portal

A rich application knowledge base and documentation, a connector repository, a library of usage examples, and information about the latest features are all available for free to help you navigate the application with confidence and feel at home .

Look

## Community portal

You can always visit our portal to share your solutions or be inspired by challenges solved by people like you, thanks to Integray. You can also provide feedback, request new features, or simply connect with others here.

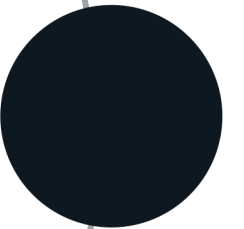

Look

## Professional support

If you don't know what to do, something stops working for you or you need a consultation, you have a team of experienced professionals who live integrations and know Integray like the back of their hand.

The form and level of support depends on the selected package.

# What Integray brings

you as

## CIO

An opportunity to reliably and **securely connect all systems** in your company

Ability **to document all your settings** (beyond the standard documentation)

**Achieving a state without outages**, missing data and satisfied end users

**First-class support** and a rich knowledge base whenever you want to use it

## IT manager

Clear management **dashboard with a view of data flows and** real-time integration

**Compatibility with all systems**, no matter how old they are or where they run

**A low barrier to entry** for new team members and quality sources of information for their education

**Analytical tools for optimization** of integrations or early resolution of errors

## IT specialist

**A modular approach to integrations** that eliminates the need to do the same thing multiple times

Wide options **for setting events for triggering integration** logic

Possibility to choose **the language according to your preferences** (Python, SQL, JavaScript...)

**Support directly from the creators of the platform** and a community portal for sharing experiences
