

## Four reasons to choose Zivver to secure your digital communications

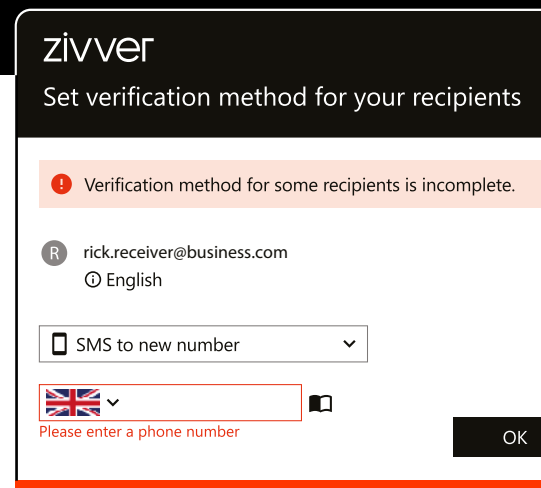

Is your security solution complicating communications for recipients and employees, or letting down your data protection team? Here are four reasons to choose Zivver.

### 01 Effortless for recipients

Security is important but so is ease-of-use. The last thing your recipients need is the complication of having to create accounts to access a simple email.

With Zivver, recipients aren't required to create accounts to access secure communications. Instead, employees can utilize MFA to protect emails and attachments, with access codes sent via SMS or pre-agreed in advance.

Plus, with expiration and recall functionality, employees can maintain full control over emails and files after sending.

### 02 Email securely from shared mailboxes

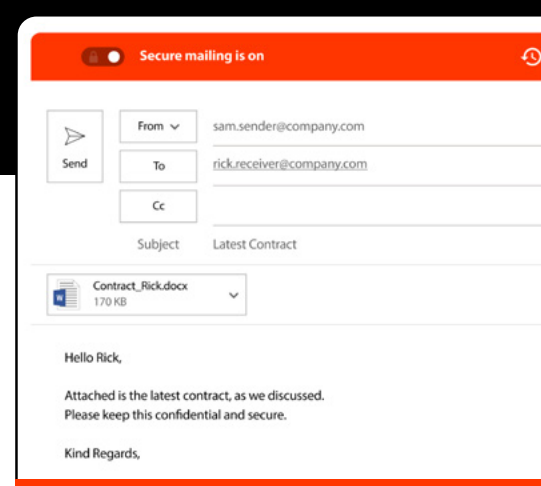

We see some organizations struggling to email securely from shared mailboxes because their email security providers require them to log in separately to send and receive secure emails.

We make managing multiple mailboxes effortless; when you log into Zivver with your own account, you are automatically logged into the shared mailboxes you manage.

### 03 Digital security simplified

Zivver integrates seamlessly with email clients (Gmail, Outlook, Office 365) and operates silently in the background; with one click, employees can apply advanced encryption and take action to prevent data leaks.

Simply put, employees like Zivver because it makes doing the right thing easy.

### 04 Compliance made simple

With Zivver, security leaders have access to data logs providing all of the detail they require to gauge the impact of a data incident – simplifying reporting to auditors when necessary and supporting compliance with data protection legislation, including the GDPR.

This is functionality lacking in other email security solutions, but is absolutely essential for businesses today.
