Application Modernisation

Regain your agility

Typical challenges	Our approach	Benefits

Typical challenges

Do your current applications offer a solid basis for your future business or will it rather be **slowed down** by them?

Are the used technologies no longer supported or even **end-of-life**?

Is the complexity out of control and are the **costs per feature** and the **number of support tickets** increasing with every new feature?

Is there a **lack of knowledge** about an application due to fluctuation or lack of documentation?

Does the further development of the application take **more and more time** and are new features **not available in time**?

Can new requirements **no longer be implemented** on the current basis?

Our approach

Our proven approach enables you to make the right investments in your IT and lay the foundation for a sustainable business model by modernizing your applications:

- **Vitality Check:** Assessment of the current application landscape as well as the development and operating structures
- **Fitness Plan:** Creation of a vision, migration scenarios and roadmap
- **Tranformation:** Modernisation and migration of applications
- **Optimisation:** Continuous development, support and operation of applications

Key success factors:
- Agile principles with focus on the users
- Value-based prioritisation
- Consideration of all relevant factors in the triangle "People, Processes & Technology".

Benefits

You make the **right investments** in your applications to create the **foundation for your future business**.

- Your applications are tailored to your current strategy and needs.
- The regained business agility allows you to take advantage of new business opportunities.
- Our approach helps us to achieve quick results and ensure business continuity during the modernization.
- Reduced maintenance efforts/costs, improved service quality and a sustainably improved time-to-market thanks to optimised architecture and processes.
