Azure Analytics Assessment

Are you considering modernizing your existing data platform or data warehouse? Are you looking at using Azure for data-related capabilities, such as BI, IoT, API, or integrations?

Your organization can gain the benefits from the cloud by creating a performant and extensible data platform in Azure.

Data platform often has several responsibilities related to data transfer, storing, enrichment, validation, governance, data warehousing, and serving the data to consuming parties in a secure manner.

With this 3-5 week project, you'll have the necessary information to make the call on the next iteration of your data platform, including the architecture design and budgetary estimates.

THE PROJECT

- The assessment is done with 2 senior experts, and consists of three to five meetings
- The meetings are expected to be attended by both business and technical stakeholders
- The deliverable is split in two documents:
    - Assessment document describes the business requirements, users and roles, design principles, ecosystem, high level architecture, technical use cases, security requirements, and the key technical Azure products used
    - Roadmap document describes the next steps with estimates for schedule and cost

THE PURPOSE

- To design a fit-for-purpose data platform scope and vision architecture
- To understand the cost and schedule of the platform development project
- To be able to make the call on the platform project's next step

NEXT STEPS

- Implement and release the first version of the platform with Zure development services
    - Our goal is to develop a concrete first version in a short time-frame and lean manner
- Maintain and improve your application with Zure's continuous services
    - Zure provides expertise and the required SLAs up to 24/7 service if required
